## 7. Interpretation Guide

- Window A represents the earlier observation segment.
- Window B represents the later observation segment.
- For availability score, higher is better.
- For response time, lower is better.
- Older snapshots may show N/A or UNKNOWN response classes because response-time classification was added after the initial watcher release.
- This comparison report is independent observation material and not an official DAC service status page.

## Status & Response-Class Glossary

| Status / Class | Meaning                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------------------|
| HEALTHY        | The endpoint or overall infrastructure state is reachable and behaving as expected.                               |
| DEGRADED       | The endpoint is reachable, but one or more checks or response-time indicators show reduced quality.               |
| PARTIAL_OUTAGE | At least one monitored endpoint is unavailable or failing while other endpoints remain reachable.                 |
| UNHEALTHY      | The endpoint failed required checks or did not provide usable responses.                                          |
| FAST           | The observed response-time class is fast for this watcher context.                                                |
| MODERATE       | The observed response-time class is acceptable but not fast.                                                      |
| SLOW           | The observed response-time class is slow and may indicate degraded user experience.                               |
| UNKNOWN        | The watcher could not classify the response-time state, often because older snapshots did not include this field. |
| N/A            | Not available or not applicable for the selected observation, endpoint, or historical snapshot.                   |
